

INTRODUCTION

The global increase of publications of systematic reviews with network meta-analyses (NMAs) to compare treatments is evident. However, this recent tool poses some challenges on the conduction and report of results. ⁽¹⁻²⁾

AIMS

We aimed to systematically characterize the worldwide publications of NMAs of drug therapy comparisons.

METHODS

A systematic review of NMAs of drug interventions was performed. Searches in Medline (PubMed) and Scopus along with manual searches were conducted. The main characteristics of NMAs were systematically collected: year/country of publication, medical condition, evaluated drugs, analytical methods used.

RESULTS

After the systematic review process, 365 NMAs (2003-2016) were included (see flowchart in Figure 1). Different drugs for several clinical conditions were evaluated (Figure 2). The map of NMAs publications shows that United States (n=115), United Kingdom (n=86), China (n=73) published more studies (Figure 3). The main characteristics of NMAs report and conduction are available in Table 1.

Figure 3. Map of NMAs. Number of publications by country (2003-2016)

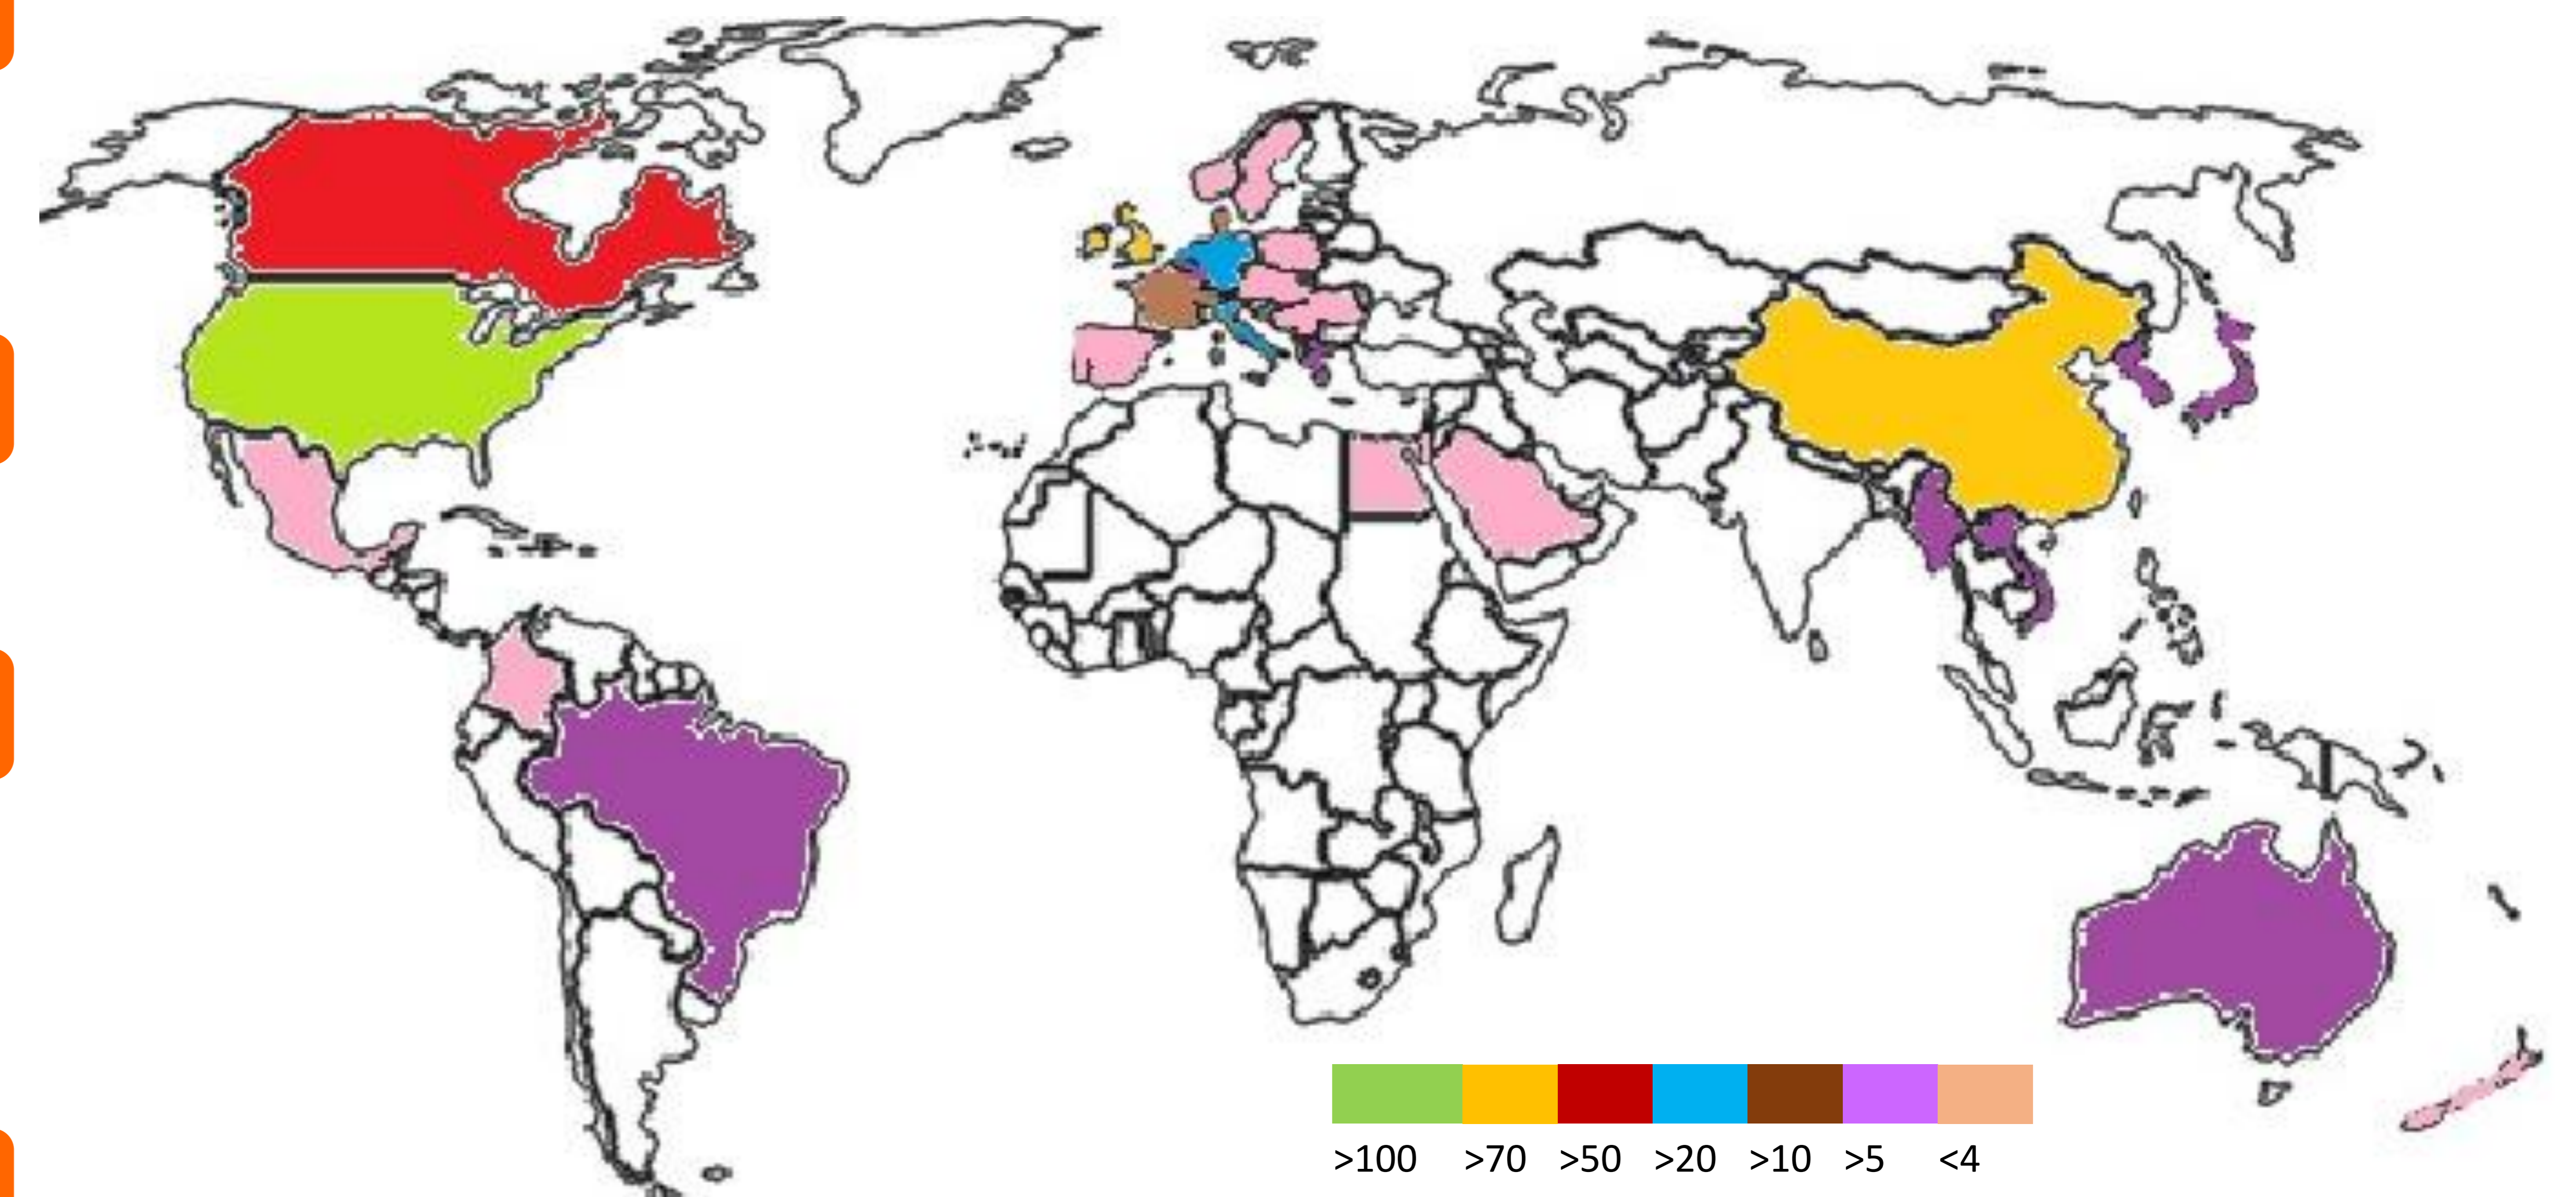

Table 1. Descriptive characteristics of articles reporting NMAs

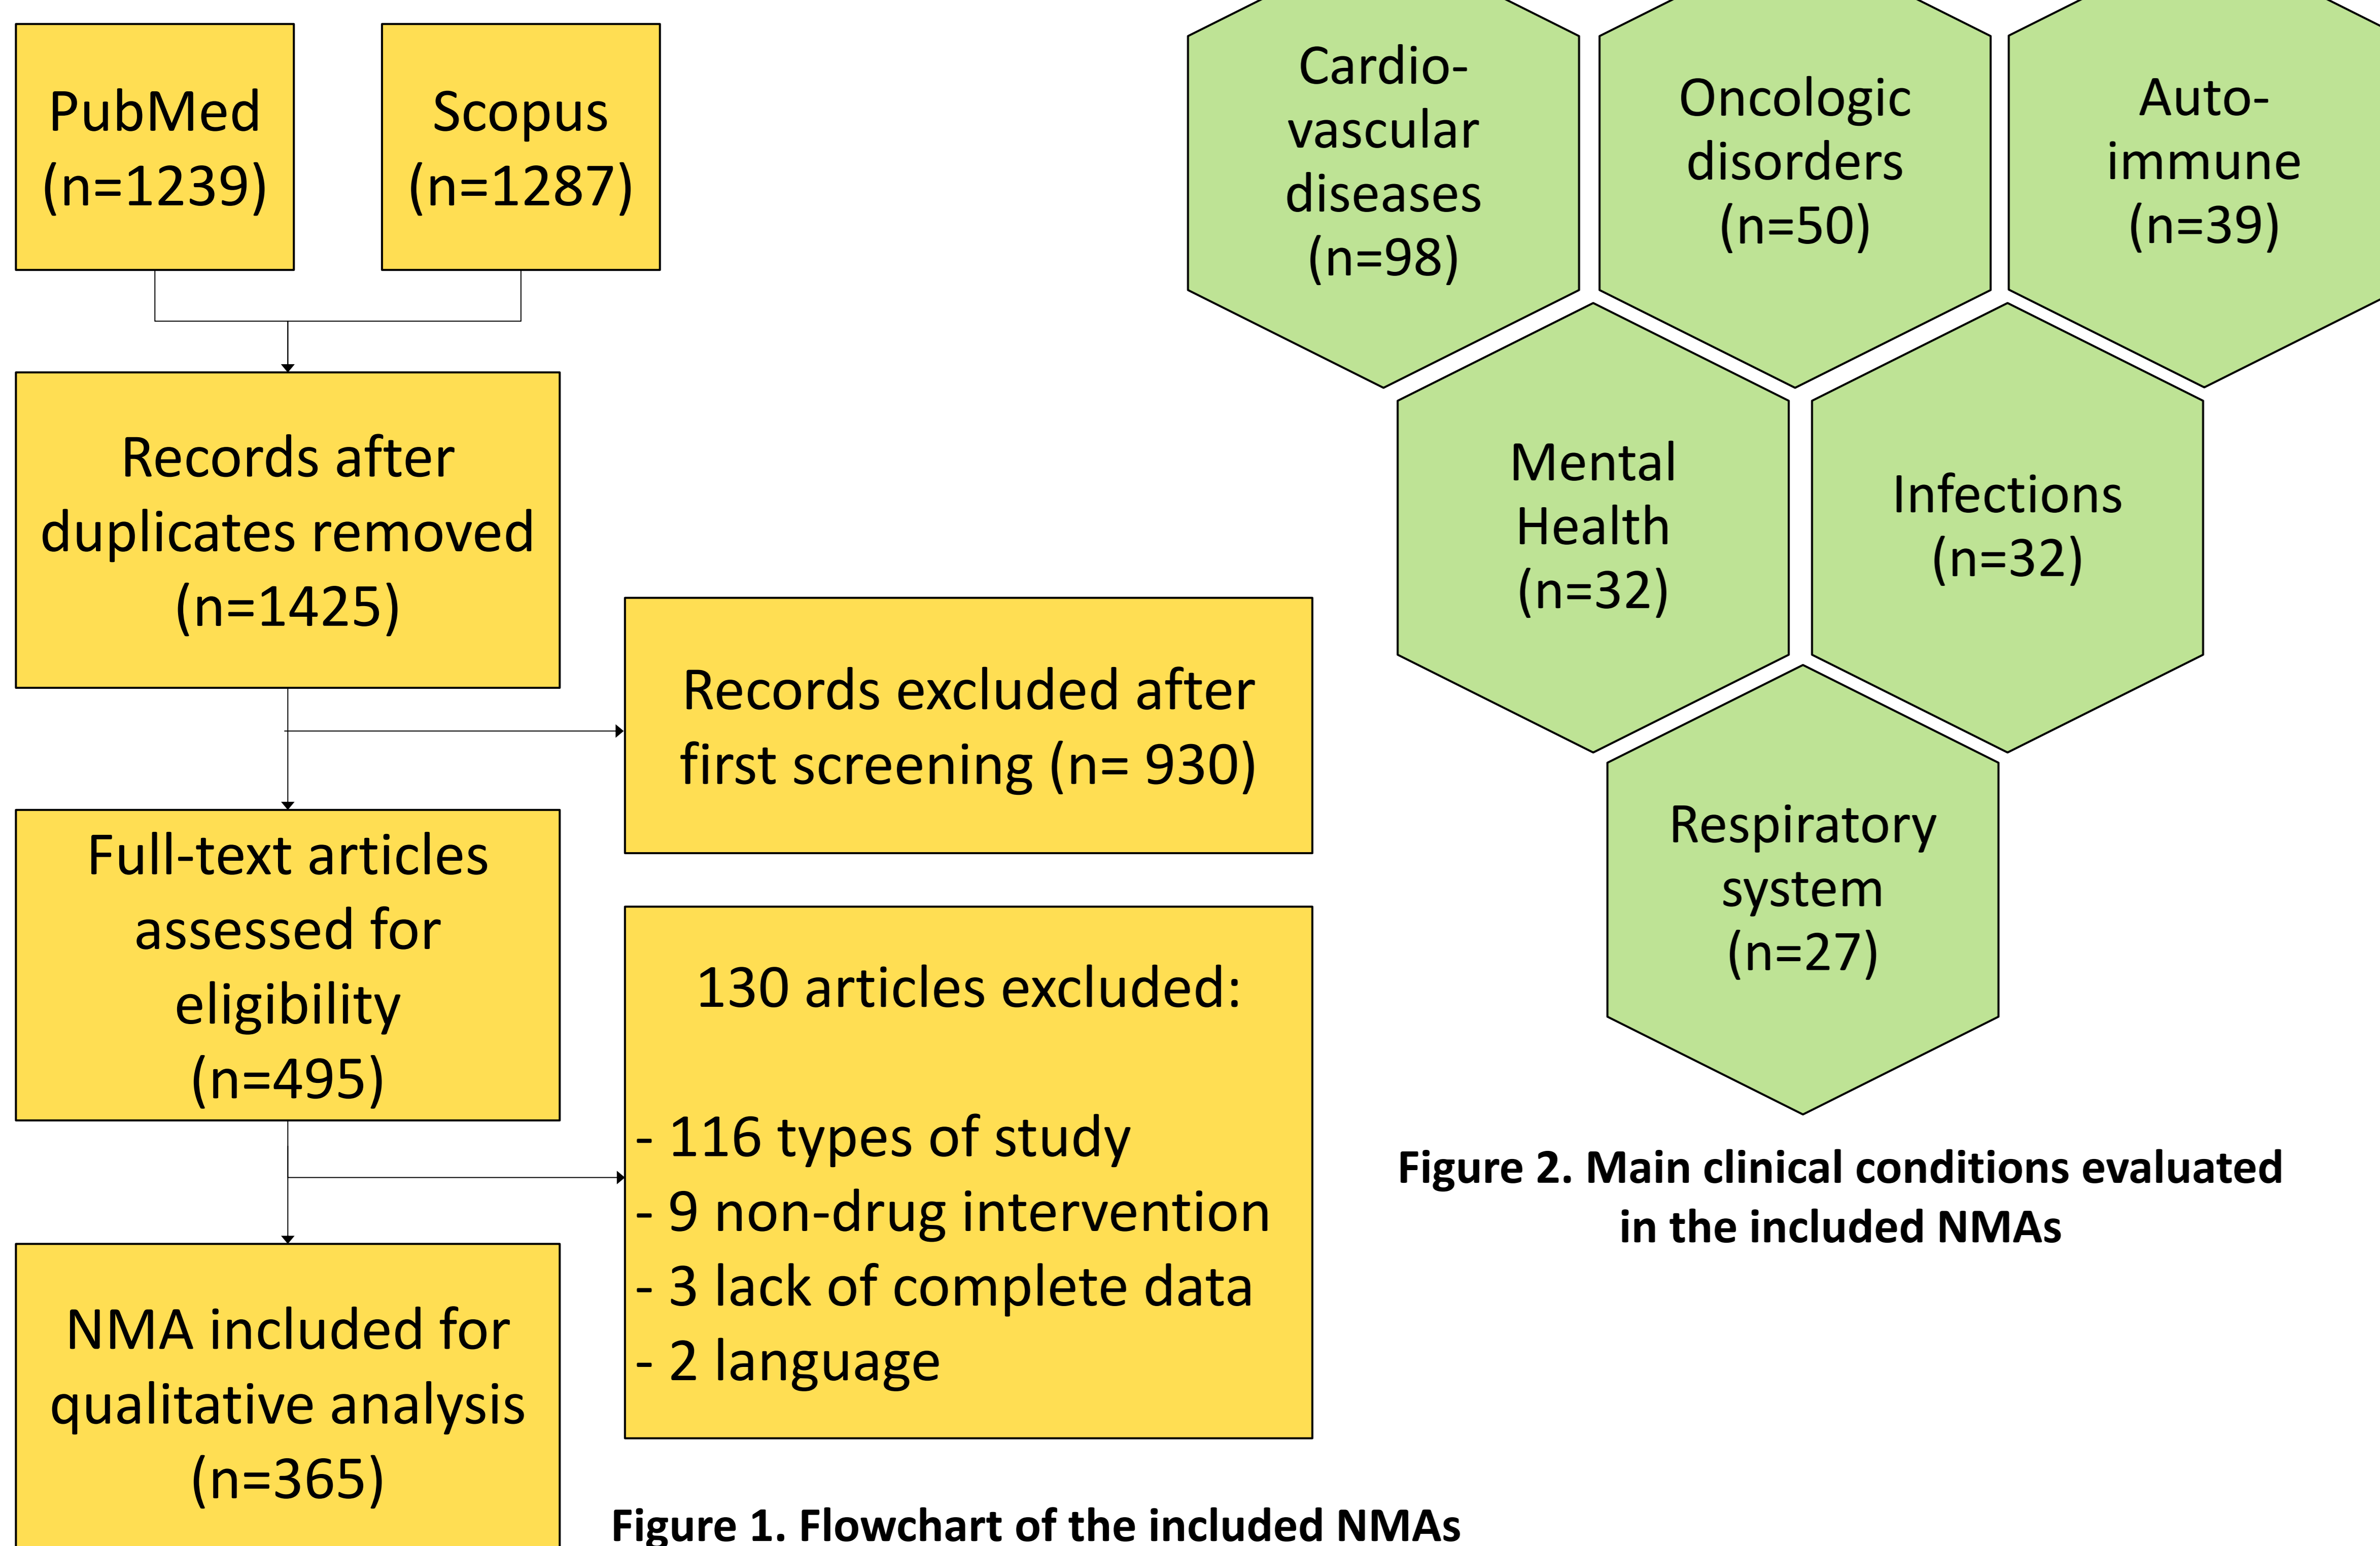

PARAMETER	No. NMA reporting data	Total	PARAMETER	No. NMA reporting data	Total
Reported PROSPERO register: N (%)	365	53 (14.5%)	Used Bayesian statistical model: N (%)	315	297 (94.2%)
Follows PRISMA statement: N (%)	365	116 (31.8%)	Presents the network plot: N (%)	365	287 (78.6%)
Follows Cochrane recommendations: N (%)	365	32 (8.8%)	Describes the network geometry: N (%)	365	200 (54.8%)
Objective criteria to select drugs: N (%)	365	146 (40.0%)	Performs sensitivity analyses: N (%)	365	207 (56.7%)
Uses placebo as comparator: N (%)	365	240 (63.0%)	Performs inconsistency analyses: N (%)	365	169 (46.3%)
Provides complete search strategy: N (%)	365	108 (29.6%)	Performs model fit analyses: N (%)	365	119 (32.6%)
Performs manual search: N (%)	365	268 (73.4%)	Presents rank order analysis: N (%)	365	216 (59.2%)
Performs grey literature search: N (%)	365	176 (48.2%)	Provides supplemental material: N (%)	365	216 (59.2%)
Performs study quality assessment: N (%)	365	193 (52.9%)	Reports conflicts of interest: N (%)	365	326 (89.3%)
Included randomized controlled trials: N (%)	365	344 (94.2%)	Reports financial support: N (%)	365	317 (86.8%)

CONCLUSIONS

Some weaknesses of conduction and reporting NMAs, namely lack of registers or studies protocols, absence of search strategies, non-objective drug selection criteria and inaccessibility of data set may bias this technique credibility and reproducibility.
